Ahmed Saad

AI Automation Developer | n8n, AI Agents, RAG

Cairo, Egypt • ahmedsaadd249@gmail.com • linkedin.com/in/ahmed-saad-872a5a397

PROFESSIONAL SUMMARY

AI automation developer who designs and builds autonomous workflow systems on n8n. Built a portfolio of 10 production-pattern automations covering retrieval-augmented chatbots, multi-tool AI agents, document extraction, and customer support triage, integrating OpenAI, Google Gemini, Pinecone, and the Google Workspace stack. Focused on converting repetitive manual business processes into systems that run end to end without human intervention.

TECHNICAL SKILLS

Automation & Orchestration: n8n (multi-node workflow design, form/webhook/schedule/app triggers, conditional branching, data mapping between nodes), process automation, end-to-end system design

AI & LLM Engineering: OpenAI (GPT-4, GPT-4.1 mini, text embeddings, image generation, Information Extractor, Text Classifier), Google Gemini, prompt design

AI Agents & RAG: AI agent architecture, tool selection and tool calling, conversational memory, Pinecone vector database, document chunking and embedding, retrieval-augmented generation, grounded question answering

Integrations & APIs: Google Drive, Google Sheets, Gmail, Google Calendar, LinkedIn API, Tavily Search API, REST and HTTP request integration, PDF text extraction

Languages: Arabic (native), English (professional working proficiency)

AUTOMATION PROJECTS

Self-directed portfolio. Apr 2026 – Present. Ten workflows built and publicly documented node by node on LinkedIn.

Document RAG Pipeline and Knowledge Chatbot

- Built a two-stage system that auto-indexes documents and answers questions from them, combining an ingestion pipeline with a conversational retrieval agent
- Engineered the ingestion side to trigger on any new Google Drive upload, chunk the file, generate OpenAI embeddings, and store vectors in Pinecone with no manual step
- Designed the retrieval agent with OpenAI, conversational memory, and a Pinecone vector store so responses are grounded strictly in the indexed source documents rather than model priors
- Generalized the pattern for reuse across company policy docs, product catalogs, and legal documentation

AI Customer Support Triage System

- Built an email support system that classifies inbound mail before acting on it, rather than replying to every message uniformly
- Implemented an OpenAI Text Classifier node to route each Gmail message into "needs a real response" or "no action required," suppressing replies to spam and irrelevant mail through a no-op branch
- Architected the responding agent on Google Gemini with a Pinecone knowledge base and OpenAI embeddings, so replies draw on company-specific data, plus memory to retain per-customer context

Content Generation and Publishing Pipeline

- Built a single-input pipeline that takes a topic from a form and produces a written post, a matching image, a logged record, and a live publication
- Designed a two-agent architecture: a writing agent using OpenAI with the Tavily Search API over HTTP Request for current supporting research, feeding a second agent that authors the image generation prompt
- Integrated GPT-4 image generation, automatic logging of every post and timestamp to Google Sheets, and direct publication to LinkedIn with text and image together

Student Complaint Handling System

- Built an automation for educational institutions replacing manual reading, response drafting, and spreadsheet entry of daily student complaints
- Designed the agent to query Google Sheets for the student's prior record before drafting, so each response reflects that student's history rather than treating every complaint as isolated
- Implemented automatic logging of each complaint, automated Gmail response to the student, and a verification read-back to confirm the record was written

Conversational Personal Assistant Agent

- Built a chat-driven agent that resolves a single natural-language instruction into a multi-step sequence across email, contacts, and calendar
- Architected the agent on GPT-4.1 mini with four tools and let it select which to invoke: a Google Sheets contacts lookup, Gmail send, Google Calendar event creation, and persistent memory
- Delivered an interface embeddable into any site or application, handling requests such as looking up a contact, emailing them, and booking a meeting from one message

Invoice Data Extraction Pipeline

- Built a document processing workflow replacing manual reading and re-keying of PDF invoices into spreadsheets
- Implemented Google Drive trigger, PDF text extraction, and an OpenAI Information Extractor to pull structured fields (supplier name, invoice number, amount, date) from unstructured invoice text
- Automated write-through to Google Sheets, GPT-4 generation of a summary message, and Gmail dispatch to the responsible team member

Bulk Image Processing Pipeline

- Built a Google Drive-triggered workflow that downloads, transforms, and re-uploads images through OpenAI image editing, with automated Gmail completion notices, targeting e-commerce catalogs requiring high-volume repetitive edits

EDUCATION

Ain Shams University, Cairo, Egypt • Bachelor of Science (B.Sc.) in Computers and Information | Expected June 2029

ADDITIONAL

Publishes technical breakdowns of each automation build on LinkedIn, documenting node-level architecture and design reasoning.
